TITLE: Organization of Work in the Thermal-Control and Automation Department  
of the Kashira Regional Electric Power Station

PERIODICAL: Sb. inform. materialov Mosenergo, 1957, Nr 14, pp 116-123

ABSTRACT: Contents of projects, organizational structure, and a list of the equipment serviced by the workers of the KIP Department, Kashira Station, are set forth. The structural scheme of the Department is presented, the number of workers and their qualifications are indicated. Equipment and instruments in the shops and laboratories are listed. The organization of work adopted in the Department has permitted attaining a high labor productivity and carrying out all installation and adjustment of new equipment.

"Dok Ak Nauk SSSR" Vol LXXXI, No 3, pp 479-482

Using liquid deutero-ammonia in the presence of potassium amide, found that rate of isotope exchange increases with the number of rings from benzene to phenanthrene. All hydrogen atoms in toluene, m-xylene, mesitylene, methylnaphthalene, anisole, methoxynaphthalene, dimethylaniline, triphenylmethane, and fluorene are exchanged. In completely hydrogenated aromatics the rate of exchange is greatly impeded. Electron-donating substituents increase the rate of exchange while electron-withdrawing substituents reduce it. In toluene, the rate of exchange of methyl hydrogen atoms is 100 times greater than that of nuclear hydrogen atoms.

TITLE: The Hydrothermal Synthesis of Corundum with  
Impurities <sup>15</sup>

PERIODICAL: Kristallografiya, 1960, Vol. 5, No. 4, pp.666-667

TEXT: The exploitation of paramagnetic materials based on the corundum structure demands the introduction into the lattice of paramagnetic ions. Cr can be introduced by the Verneuil process but not Fe, Ti nor other elements. Nevertheless, natural specimens exist with significant quantities of these impurities. ✓  
The hydrothermal methods successfully used in the USSR for growing quartz can also be used for corundum. Specimens made in this way were tested radiospectroscopically and by X-ray methods. It has been shown that  $Fe^{+++}$  ions entered the lattice isomorphously replacing the  $Al^{+++}$  ions. The concentrations achieved were one or two orders of magnitude greater than could be achieved by the Verneuil process. Spherical seeds gave crystals with the following simple forms: {0001}, {1011}, {2243} and {2241}. There are 2 figures and 2 references: 1 German and 1 English.

Title: Peculiarities of operating diesel engines on high-sulfur fuel  
Period: Morskoy sbornik, no. 3, 1965, 75-77

TOPIC TAGS: diesel, fuel, sulfur, corrosion, cooling system, metal wear / 37 ER  
diesel engine

ABSTRACT: An explanation is proposed and a remedy is suggested for the rapid wear of pistons and other parts of diesel engines operated on high-sulfur fuels. It is explained that water vapor in the blown air interacts with the fuel to form sulfuric acid. At a low temperature, sulfuric acid condenses, attacking the piston.

Two cases... Two examples of damage and lowered efficiency of diesel engines are presented in detail. To lower the corrosive action of the blowing air, the temperature of cooling water must be raised. According to V. A. Brus and A. A. Rukhter (Rezhimnye raboty sudovykh dizeley, 1963, 14-152, the wear  
Card 1/2

- 52362465

ACCESSION NR: AP5013504

of diesel cylinders is lowered by a factor of 12 when the temperature of cooling water is raised by 40-50C. In some high-speed diesels, the cylinder cooling water which is presently being warmed, eventually will have to be cooled. This will require a large quantity of water for main engine cooling and auxiliary heating; this will prove difficult. It is recommended to follow the cooling system to allow for circulation of cooling water after the steam from auxiliary generators has been exhausted, as shown in figure.

TITLE: Investigation of the Thermal Activation Energy of a [Luminescence] Flash and the Localization Levels in CaS-Based Phosphors  $\gamma$ 

PERIODICAL: Optika i spektroskopiya, 1960, Vol 8, Nr 6, pp 875-877 (USSR)

ABSTRACT: The thermal activation energy of a luminescence flash is that energy (supplied by the thermal vibrations of the lattice) which is necessary to transfer electrons from deep localization levels to more shallow ones so that they produce a flash when stimulated with infrared light. The following phosphors were investigated: CaS; Ca-Sm( $3 \times 10^{-5}$ ); CaS-Cu( $2.3 \times 10^{-4}$ ); CaS-Bi( $3 \times 10^{-5}$ ); CaS-Bi( $3 \times 10^{-5}$ ),Ce( $1.4 \times 10^{-4}$ ); CaS-Bi( $3 \times 10^{-5}$ ),Eu( $1.3 \times 10^{-4}$ ); CaS-Bi( $3 \times 10^{-5}$ ),Pr( $1.4 \times 10^{-4}$ ); CaS-Sm( $3 \times 10^{-5}$ ),Cu( $2.3 \times 10^{-4}$ ); CaS-Sm( $3 \times 10^{-5}$ ),Ce( $10^{-4}$ ). The phosphors were prepared from CaCO<sub>3</sub> which was heated to 1000°C to form CaO. Na<sub>2</sub>SO<sub>4</sub> flux was used in the amount of 4%. The temperature and duration of final calcination were 1050°C and 25 min. The luminescence flash and thermoluminescence were investigated using apparatus described earlier (Ref 5). Thermoluminescence curves are given in a figure on

Investigation of the Thermal Activation Energy of a [Luminescence] Flash and the Localization Levels in CaS-Based Phosphors

p 876; they show the effect of activators on formation of localization levels. To study the luminescence flash the authors used the phosphors CaS-Sm,Cu and CaS-Sm,Ce whose flashes had low inertia and which had negligible secondary phosphorescence. These two phosphors had five localization levels, the most important of which were those represented by thermoluminescence peaks at +30°C and 150°C. To find the thermal activation energy,  $\Delta E$ , of the +150°C level of CaS-Sm,Cu the phosphor was excited for 10 min at +80°C; to find  $\Delta E$  of the +30°C levels of CaS-Sm,Cu and CaS-Sm,Ce the phosphors were excited at +7-10°C. Then the flashes were stimulated at various temperatures with infrared radiation of 0.8-1.2  $\mu$  wavelengths. The thermal activation energy of the flash was found from:

$$\lg \frac{I_0}{I_b} = 0.43 \frac{\Delta E}{kT}, \quad (2)$$

where  $I_b/I_0$  is the relative luminance of the flash at a temperature T.

TITLE: Complexes of diphenyl ethylene with tin tetrachloride and  
organotin chlorides

PERIODICAL: Akademiya nauk SSSR. Doklady, v. 138, no. 4, 1961, 839-842

TEXT: The authors studied complexes of asymmetric diphenyl ethylene (DPE) with  $\text{SnCl}_4$ ,  $\text{C}_6\text{H}_5\text{SnCl}_3$ , and  $(\text{C}_6\text{H}_5)_2\text{SnCl}_2$ . The catalytic activity of  $\text{SnCl}_4$  is explained with the formation of  $\pi$ -complexes with monomers without ever clarifying the nature of these complexes. The authors studied then by (A) infrared spectra, (B) electron spectra, and (C) dielectric polarization. In previous papers (I. P. Gol'dshteyn et al., Ref. 4: DAN, 136, No. 5 (1961)) it had been found by method (C) that the mentioned compounds formed a series according to their capability of forming complexes with dioxane:  
 $\text{SnCl}_4 > \text{C}_6\text{H}_5\text{SnCl}_3 \gg (\text{C}_6\text{H}_5)_2\text{SnCl}_2$ . The authors tried to find out whether or

Card 1/5

B103/B203

Complexes of diphenyl ethylene with tin...

not this series was also maintained in complexes with monomers. The following systems were studied: (a)  $\text{SnCl}_4 + \text{DPE}$ , (b)  $\text{C}_6\text{H}_5\text{SnCl}_3 + \text{DPE}$ , (c)  $(\text{C}_6\text{H}_5)_2\text{SnCl}_2 + \text{DPE}$ , (d)  $\text{SnCl}_4 + \text{DPE} + \text{DPE-dimer}$ , and (e)  $\text{C}_6\text{H}_5\text{SnCl}_3 + \text{DPE} + \text{DPE-dimer}$ . (A) The spectra were taken with a split-beam spectrophotometer N-800 (N-800) with fluorite cuvettes and Teflon insertions ( $20 \mu$ ). The mixtures were prepared in an airtight chamber in dry nitrogen and filled into cuvettes.  $\text{SnCl}_4$  and  $\text{C}_6\text{H}_5\text{SnCl}_3$  in DPE give green solutions with an absorption band  $610 \text{ m}\mu$  and an intensive absorption below  $500 \text{ m}\mu$ . (B) The electron spectra were taken with an C $\phi$ -4 (SF-4) spectrophotometer in benzene solution. Results of (A): As compared with the spectra of pure DPE, the spectra of systems (a) and (b) show considerable changes: (1) The bands of the region  $1612$ ,  $1420 - 1400$ , and  $1335 \text{ cm}^{-1}$  disappear, the intensity of the band  $1578 \text{ cm}^{-1}$  decreases strongly. They are all connected with the double bond in the molecule of diphenyl ethylene. The band  $1615 \text{ cm}^{-1}$  belongs to the stretching vibrations of the  $\text{C} = \text{C}$  double bond whose frequency is reduced owing to the conjunction with phenyl rings. The bands  $1400$  and  $1330 \text{ cm}^{-1}$  belong to the deformation vibrations of the methylene group on the double bond. The band  $1578 \text{ cm}^{-1}$  belongs to the vibrations of

Card 2/5

B103/B203

Complexes of diphenyl ethylene with tin...

the phenyl ring. Its intensity increases strongly due to the interaction with the conjugate double bonds. (2) New bands appear in the regions 1376, 1250, and 1220  $\text{cm}^{-1}$ . (3) The band 1605  $\text{cm}^{-1}$  of the benzene ring vibration is slightly shifted, and its intensity increases. Besides, the authors measured the spectrum of the solution of the DPE dimer in DPE to prove that the above-mentioned changes (1)-(3) are not connected with the appearance of the dimer in the above systems. This spectrum shows two additional bands which are absent in the spectrum of the monomer. The band 1665  $\text{cm}^{-1}$  belongs to the stretching vibrations of the C = C bond in the dimer. The band 1285  $\text{cm}^{-1}$  possibly belongs to the CH deformation vibrations on the double bond. None of these two bands appears in the spectra of systems (a) and (b). The authors consider this fact as a proof that the changes (1)-(3) in the infrared spectra are not caused by the dimer but by the intermediates of the interaction of DPE with the tin halides. Further spectral data suggest that the dimer also forms complexes with  $\text{SnCl}_4$  and  $\text{C}_6\text{H}_5\text{SnCl}_3$ . (C) The authors measured the dipole moment of DPE in benzene solution with excess  $\text{SnCl}_4$ , and obtained the value 1D. Thus, it lies by 0.7-0.8 D higher than the dipole moment in benzene. For these reasons, the Card 3/5

## Complexes of diphenyl ethylene with tin...

authors think that the band 480 m $\mu$  (contrary to statements made by A. G. Evans et al. (see below)) cannot be explained with carbonium ions. The absorption band in the region 610 m $\mu$  may be ascribed to the  $\pi$ -complex. According to A. N. Terenin et al. (Ref. 10; Optika i spektroskopiya, 3, 480 (1957); Izv. AN SSSR, OKhN, 1958, 1100), the frequency of the valency formation decreases by 115-195 cm $^{-1}$  in the complex formation from cyclohexane and SnCl<sub>4</sub>; besides, absorption bands appear in the region 1400-1340 and 1200 cm $^{-1}$ : The band 1525 cm $^{-1}$  in systems (d) and (e) is ascribed to the reduced (by 140 cm $^{-1}$ ) frequency of vibrations of the double bond in the  $\pi$ -complex of the dimer with the tin halides. In contrast to systems (a) and (b), the authors had not found any indications of a formation of  $\pi$ -complexes in system (c). The solutions of the latter in benzene are colorless, and no changes were observed in their infrared spectrum as compared with the spectra of components. Thus, the authors proved that the above-mentioned order was also maintained in the case of complexes with monomers. They conclude that C<sub>6</sub>H<sub>5</sub>SnCl<sub>3</sub> can also be a catalyst for the polymerization of olefins whereas this cannot be expected for (C<sub>6</sub>H<sub>5</sub>)<sub>2</sub>SnCl<sub>2</sub>. There are 3 figures, 1 table, and 10 references: 5 Soviet-bloc and 5 non-

TITLE: Electrical conductivity study of the polymerization kinetics of unsaturated oligomers exposed to Co<sup>60</sup> gamma radiation

SOURCE: Vysokomolekulyarnyye soyedineniya, v. 8, no. 7, 1966, 1180-1184

TOPIC TAGS: polymerization kinetics, polyester plastic, oligomer, electric conductivity, ionizing radiation, radiation effect, gamma radiation

ABSTRACT: Polymerization induced by ionizing radiation was studied for the first time by means of the electrical conductivity method proposed by R. W. Warfield and M. C. Petree (J. Polymer Sci., 37, 305, 1959) for studying the kinetics of thermal curing of resins. The experiments involved the unsaturated polyester resin PN-1. Measurements of the volume conductivity  $\rho_v$  of the resin during polymerization were compared with data on the degree of polymerization, obtained by measuring the concentration of  $-C=C-$  double bonds by IR spectroscopy and the content of the gel fraction by extraction. It was thus shown that the degree of polymerization can be obtained from  $\rho_v$ . The polymerization kinetics of PN-1 were determined in the range of 30 to 85°C at dose rates from 50 to 318 r/sec. The kinetic data showed that the curing process is governed by

AUTHOR: Fayzibayev, E. F.

TITLE: The problem of oscillations in systems close to exactly integrable systems

PERIODICAL: Akademiya nauk Uzbekskoy SSR. Izvestiya. Seriya fiziko-matematicheskikh nauk, no. 4, 1962, 17 - 21

TEXT: The author considers an oscillation process which is described by the equation

$$\frac{d^2x}{dt^2} + f(\tau, x) = \varepsilon F(\tau, x, dx/dt, \varepsilon) \quad (1)$$

( $\tau = \varepsilon t$ ). The amplitude  $a$  and the phase  $\psi$  are correlated with two given functions  $u_1$  and  $v_1$  by the relations  $a = a_1 + \varepsilon u_1(\tau, \psi_1, a_1)$  and  $\psi = \psi_1 + \varepsilon v_1(\tau, \psi_1, a_1)$ , where  $a_1$  and  $\psi_1$  satisfy a system of the form

$$\left. \begin{aligned} \frac{da_1}{dt} &= \varepsilon \Phi_{10}^{(0)}(\tau, a_1), \\ \frac{d\psi_1}{dt} &= \omega(\tau, a_1) + \varepsilon [\omega_a'(\tau, a_1)u_{10}(\tau, a_1) + \Phi_{20}^{(0)}(\tau, a_1)] \end{aligned} \right\} \quad (3)$$

S/166/62/000/004/002/010  
B112/B186

The problem of oscillations in...

The functions  $\Phi_{10}^{(o)}$  and  $\Phi_{20}^{(o)}$  are solutions to the equation of the unperturbed motion. These solutions, however, cannot be determined in all cases. Therefore, the author expresses the right-hand sides of the system (3) by known functions of  $f$  and  $F$ . The following result is obtained:

$$\frac{du_1}{dt} = \omega(\tau, a_1) + \epsilon \omega_a^1(\tau, a_1) u_{10}(\tau, a_1) - \epsilon \int_{-a}^a \frac{(P + Q)(M - N)u_0}{2sN \int_{-a}^a (P - Q)dz} dz,$$

where

$$M = \sqrt{2[v(\tau, a) - v(\tau, z)]} \cdot (\sqrt{2[v(\tau, a) - v(\tau, z)]})^i,$$

$$N = v'_z(\tau, a) - v'_z(\tau, z),$$

$$P = F\left(\tau, z, -\sqrt{2[v(\tau, a) - v(\tau, z)]}, 0\right) - \\ - F\left(\tau, z, \sqrt{2[v(\tau, a) - v(\tau, z)]}, 0\right).$$

CRIG. PUB.	:	Byul. nauchno-tekhn. inform. Kazansk. n.-i. vet. in-ta, 1958, No 3, 42-43
ABSTRACT	:	The experiment was carried out on 1,735 sheep affected with fascioliasis. Difluorotetrachloro- ethane ( $C_2F_2Cl_4$ ), known as Freon 112, was intro- duced into the rumen in a dose of 0.3-0.4 ml/kg. Extensity effectiveness of the preparation amounted to 68-89% and intensity effectiveness was about 90%. Side effects were not observed.

Abstract : The following innovations and devices are briefly described: a triode converter for the 6N15P tubes used in amateur television sets and UHF radio receivers; a universal brace for holding coil bodies in place on a winding machine; a method for eliminating self-exitations in an intermediate frequency amplifier; and a method for calibrating scales on measuring instruments. Circuit diagrams; drawings.

✓4365. Design of a cathode follower for pulse operation. B. N. FAIZULAEV. Radiotekhnika, 10, No. 5, 39-49 (1955) in Russian.

A trapezoidal pulse with amplitude  $V_1$  and rising edge time  $t_r$  is applied to the cathode follower (c.f.) with given cathode resistance  $R_k$  and capacitance  $C_k$ . Simplifying assumptions are made which permit the treating of c.f. as an integrating circuit and the evaluation of the shape and lag of the pulse at the output. The optimum conditions, consisting of the least distortion of pulse, are found for given valve constants, and given values of  $R_k$  and  $C_k$  and of input and output voltages. These values are discussed for homopolar pulses, but they are also valid for bipolar pulses. The equivalent input capacitance is found. It is shown that when the time lag and distortion of the rising edge of the pulse is not taken into account, it gives erroneous values of input capacitance for rising edges of short duration. The same effect of rising edge lag will occur with h.f. sinusoidal waves and must be taken into account in the calculations of output voltage and equivalent input capacitance.
